1 Introduction

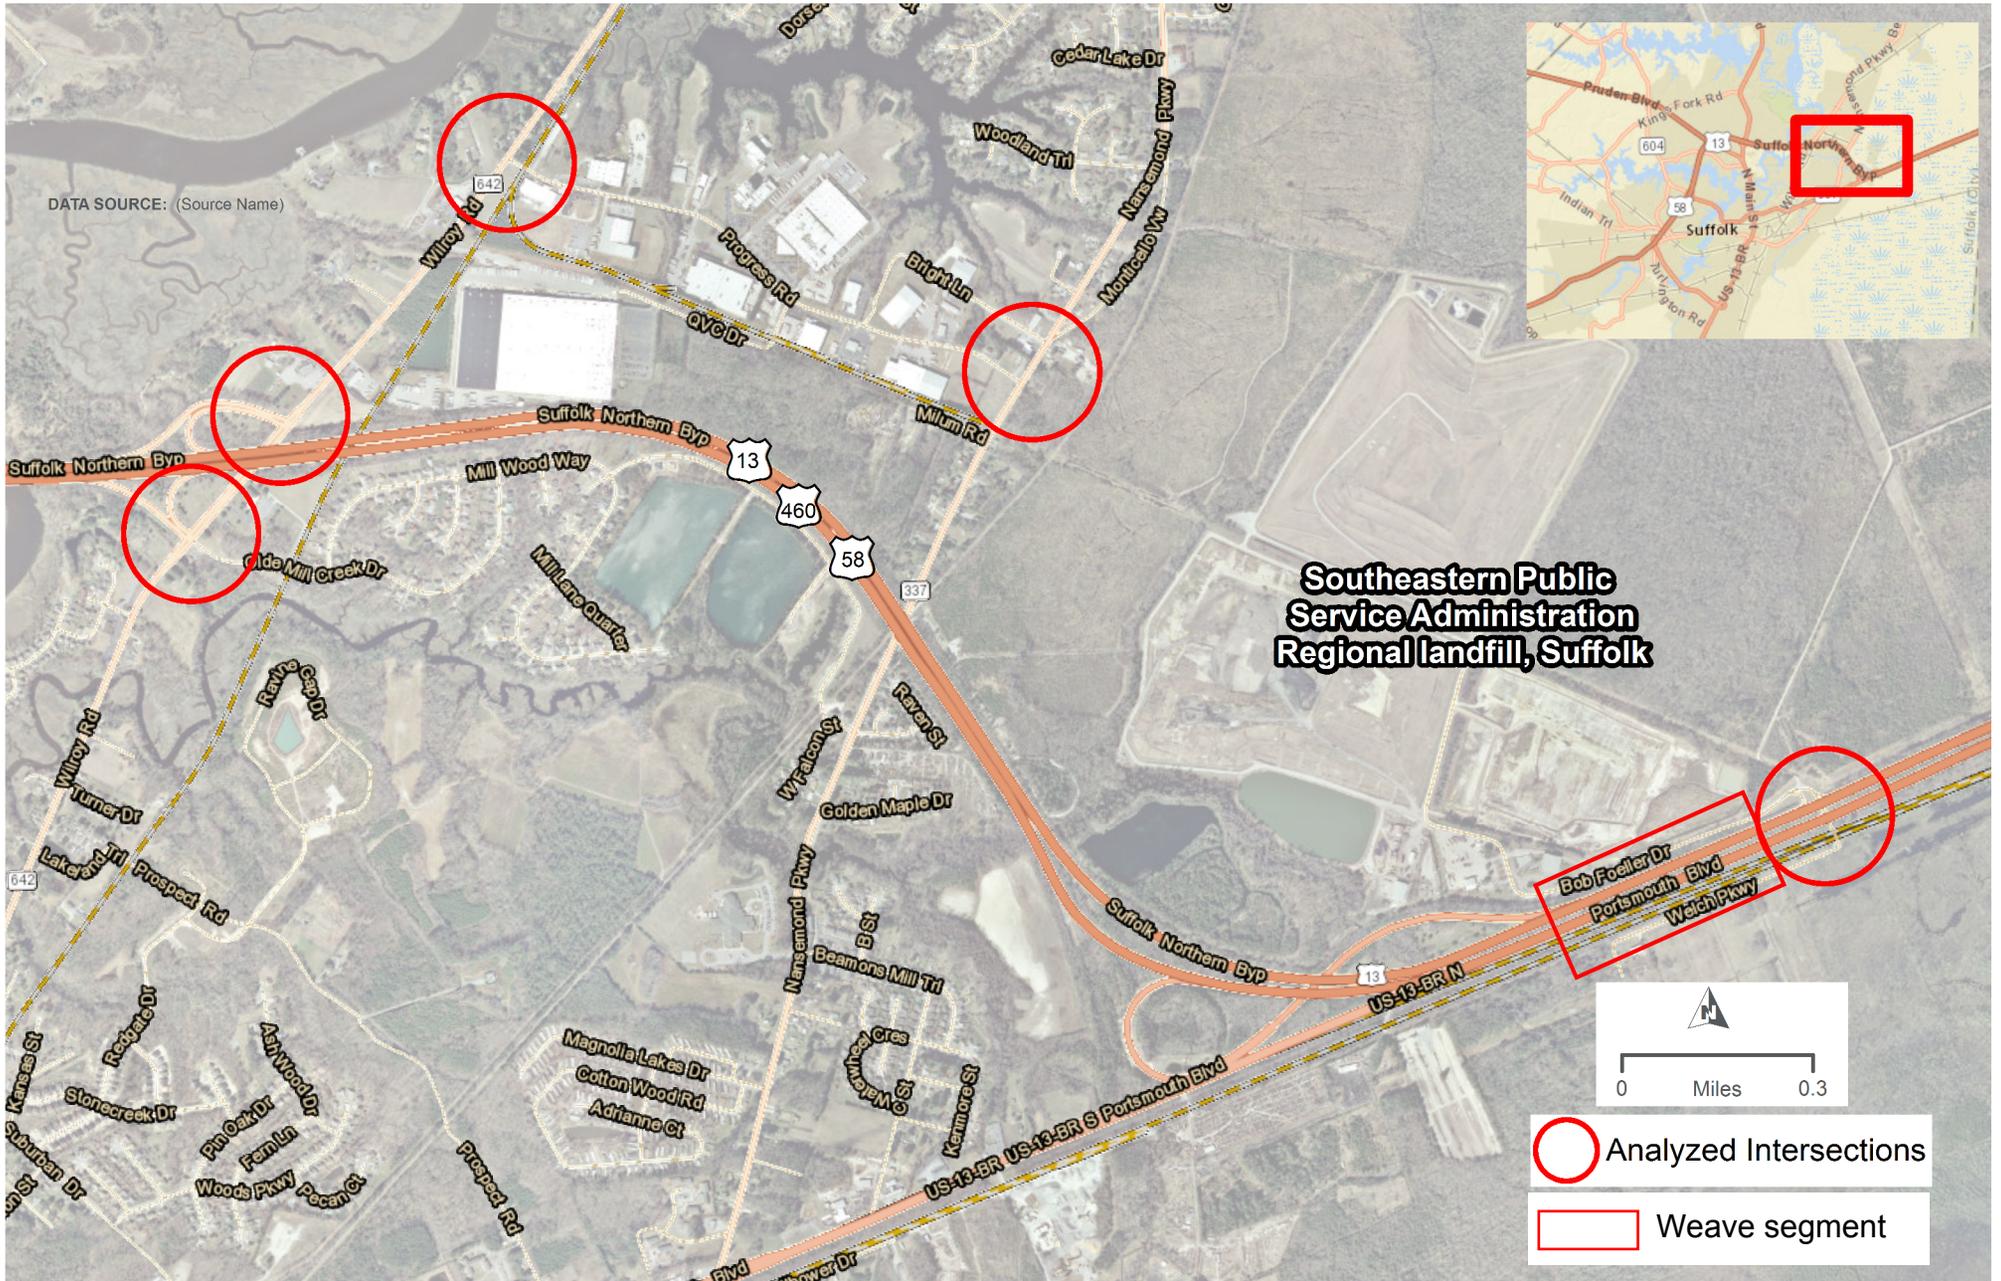

The Southeastern Public Service Authority (SPSA) is submitting applications for a Conditional Use Permit and Conditional Rezoning for modification to its Regional Landfill, located at #1 Bob Foeller Drive in the City of Suffolk. The modification includes the proposed construction of a new landfill cell, Cell VII, on the existing landfill site, and development of a soil borrow area or vegetative waste composting system on the existing property north of Cell VII. The property is located north of the West Military Highway (Route 13/58/460), Bob Foeller Drive, and Welch Parkway intersection. Figure 1 displays a study area map.

It is anticipated that construction of Cell VII will take place one to two years prior to the completion of waste filling operations in Cells V and VI. Cell V and VII operations are anticipated to continue through at least 2024, based on current and anticipated disposal rates, and could possibly extend up to 2040 depending on the success of planned alternative waste disposal strategies. For purposes of this study, HDR has assumed that Cell VII and the compost operations would begin in 2030, and that Cell VII would have a projected life span of 25 years.

The new Cell VII and compost operations will be accessed using the existing facility entrance roadway, Bob Foeller Drive. The proposed access on Route 13/58/460 is an existing partial access with an existing median crossing. The landfill eastbound traffic on Route 13/58/460 must make a right onto westbound Route 13/58/460 and use the loop ramp that is located approximately 3000 feet to the west of the Bob Foeller Drive and Welch Parkway intersection.

HDR understands that the Virginia Department of Transportation (VDOT) is planning to complete a study and conceptual design for a flyover or interchange between westbound and eastbound Routes 13/58/460 east of the facility, which would provide an alternative for the median crossing traffic entrance to the facility. VDOT funding for this regional study and construction of the flyover is not assured and the actual timing for the implementation of this regional traffic improvements is not known. This study and its second alternative has assumed that the flyover is not available for traffic flow at the time Cell VII is operational.

The purpose of this report is to document the impacts of the existing entrance and exit and access requirements for the proposed site. Analysis of existing conditions is presented in the Section 2. Section 3 contains the analysis of future conditions without development. Trips and forecasted traffic volumes is presented in the Section 4 of this report. The capacity analysis for the proposed facility with development is documented in Section 5. The signal warrants analysis is presented in Section 6. Finally, Sections 7 & 8 summarize the study findings and present the recommendations and conclusions.

2 Existing Conditions

This section presents the existing traffic operational analysis for the peak hour traffic volumes for the analyzed intersections and weaving segment.

As shown in the study area map, the study area includes five intersections plus a weave segment of Route 13/58/460 that are being analyzed for this project:

- Route 13/58/460, Bob Foeller Drive, and Welch Parkway
- Bob Foeller Drive Merge Ramp onto Route 13/58/460 Westbound
- Nanesmond Parkway and Progress Road
- Wilroy Road and Progress Road
- Wilroy Road and Route 13/58/460 West Bound Ramps
- Wilroy Road and Route 13/58/460 East Bound Ramps

The current entrance to the SPSA landfill site can only be accessed via Bob Foeller Drive located at the south of the site. Bob Foeller Drive intersects with Route 13/58/460 to the southeast of the SPSA landfill facility. Bob Foeller Drive is named as Welch Parkway to the south of Route 13/58/460. Presently, a locked gate controls access to Welch Parkway. Route 13/58/460 is a divided six-lane highway with a grass median and Bob Foeller Drive and Welch Parkway are both two-lane local roadways. There is an exclusive left turn lane and free flow lane to the SPSA landfill site on the westbound approach and an exclusive left turn lane on the eastbound approach. The storage bay for the westbound right turn lane and for the eastbound left turn is approximately 300 feet. All the movements to and from Bob Foeller Drive are stop controlled except the free flowing right turn movement to Bob Foeller Drive from Route 13/58/460 and the free flowing right turn movement from Bob Foeller Drive to Route 13/58/460.

Progress Road is an east-west two-lane local roadway facility with a continuous two-way center left-turning lane. Progress Road intersects with Nansemond Parkway at the east end and Wilroy Road at the west end. The Wilroy Road intersection with Progress Road is a signalized intersection. However, the intersection of Progress Road and Nansemond Road is an unsignalized intersection with a stop sign on Progress Road. Nansemond Parkway is a north-south two-lane local roadway with a double yellow centerline to the east of the intersection with Progress Road and a skipped yellow center line to the west. Wilroy Road is also a two-lane local roadway with double yellow center line.

There is an existing interchange between Wilroy Road and Route 13/58/460 to the south of the signalized intersection of Wilroy Road and Progress Road. Wilroy Road goes under Route 13/58/460 with access ramps for both eastbound and westbound traffic to/from Route 13/58/460. The eastbound access ramps to/from Route 13/58/460 are located to the north of the interchange, whereas the westbound access ramps are to the south. Both the access ramps are signalized intersections at Wilroy Road. Additionally, Wilroy Road becomes a four-lane local roadway with a raised grass median within the interchange limits with Route 13/58/460.

To determine the existing conditions, Intermodal Engineering, P.C. conducted a peak hour volume and turning movement count during the a.m. peak period from 7:00- 9:00 a.m. and the p.m. peak period from 2:00 -4:30 p.m. The counts were conducted on the following days:

- Intersection of Bob Foeller Drive and West Military Highway (Route 13/58/460) - Wednesday, April 13, 2016.
- Bob Foeller Drive Merge Ramp onto Route 13/58/460 Westbound – Wednesday, April 13, 2016.
- Intersection of Nanesmond Parkway and Progress Road – Thursday, June 2, 2016
- Intersection of Wilroy Road and Progress Road – Tuesday, June 14, 2016
- Intersection of Wilroy Road and East Bound/West Bound Ramps - Thursday, June 2, 2016

Level of service (LOS) is a qualitative measure used to describe the condition of traffic flow, ranging from excellent free-flow conditions at LOS A to overloaded stop-and-go conditions at LOS F. LOS C is typically considered to be the minimum acceptable level of service in rural areas. LOS at all five intersections were analyzed using Synchro 8.0. LOS for the weaving segment was analyzed using the FHWA's Highway Capacity Software.

2.1 Existing LOS Summaries

2.1.1 Intersection of Route 13/58/460, Bob Foeller Drive, and Welch Parkway

The intersection functions at an unacceptable level of service in the a.m. and p.m. peak hour. This is due to the heavy volumes on the Route 13/58/460 approaches as shown on Figure 2A. For analysis results summary see Table 1 and full reports in Appendix C.

2.1.2 Bob Foeller Drive Merge Ramp on to Route 13/58/460 Westbound

The weave segment functions at an acceptable level of service in the a.m. and p.m. peak hour. This is due to the low volumes making the ramp to freeway movement. For analysis results summary, see Table 2 and full reports in Appendix C.

2.1.3 Intersection of Nansmond Parkway and Progress Road

The intersection functions at an acceptable level of service in the a.m. and p.m. peak hour. Existing conditions volumes are displayed on Figure 2B. For analysis results summary, see Table 3 and full reports in Appendix C.

2.1.4 Intersection of Wilroy Road and Progress Road

The intersection functions at an acceptable level of service in the a.m. and p.m. peak hour. Existing conditions volumes are displayed on Figure 2C. For analysis results summary, see Table 4 and full reports in Appendix C.

2.1.5 Intersection of Wilroy Road and Route 13/58/460 WB off/on Ramps

The intersection functions at an acceptable level of service in the a.m. and an unacceptable level of service in the p.m. peak hour. This is due to the intersection being unsignalized and the heavy volumes on the Wilroy Road approaches as show on Figure 2D. For analysis results summary, see Table 5 and full reports in Appendix C.

2.1.6 Intersection of Wilroy Road and Route 13/58/460 EB off/on Ramps

The intersection functions at an acceptable level of service in the a.m. and p.m. peak hour. Existing conditions volumes are displayed on Figure 2E. For analysis results summary, see Table 6 and full reports in Appendix C.

3 Analysis of Future Conditions without Development

The volumes used for the analysis of the existing conditions were used as the background volumes for the No-Build conditions. To analyze the No-Build conditions, the background traffic was forecast using the growth rates found in the next section. The a.m. and p.m. peak hour levels of service for study area intersections and ramp were computed by utilizing the Synchro 8.0 and HCM 2010.

3.1 No-Build LOS Summaries

3.1.1 Intersection of Route 13/58/460, Bob Foeller Drive, and Welch Parkway

The intersection functions at an unacceptable level of service in the a.m. and p.m. peak hour. This is due to the heavy volumes on the Route 13/58/460 approaches as shown on Figure 3A. For analysis results summary, see Table 1 and full reports in Appendix C.

3.1.2 Bob Foeller Drive Merge Ramp on to Route 13/58/460 Westbound

The weave segment functions at an acceptable level of service in the a.m. and p.m. peak hour. This is due to the low volumes making the ramp to freeway movement. For analysis results summary, see Table 2 and full reports in Appendix C.

3.1.3 Intersection of Nansemond Parkway and Progress Road

The intersection functions at an acceptable level of service in the a.m. and p.m. peak hour. No-Build conditions volumes are displayed on Figure 3B. For analysis results summary, see Table 3 and full reports in Appendix C.

3.1.4 Intersection of Wilroy Road and Progress Road

The intersection functions at an acceptable level of service in the a.m. and p.m. peak hour. No-Build conditions volumes are displayed on Figure 3C. For analysis results summary, see Table 4 and full reports in Appendix C.

3.1.5 Intersection of Wilroy Road and Route 13/58/460 WB off/on Ramps

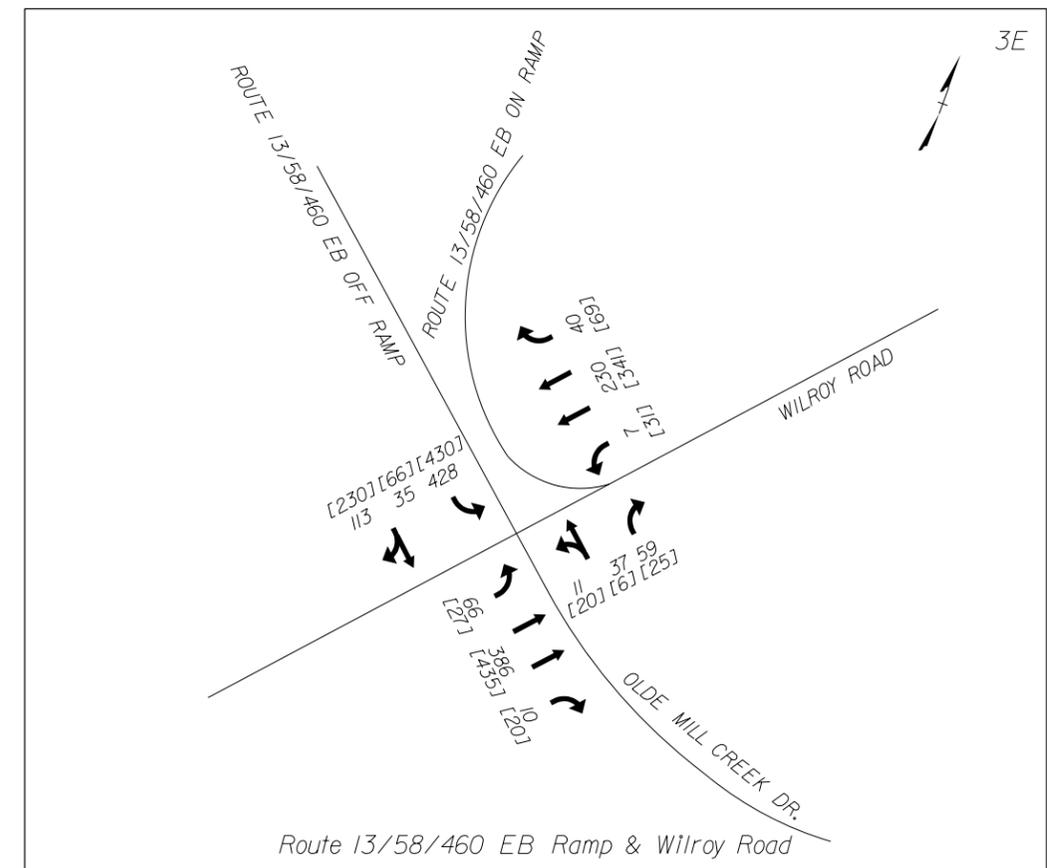

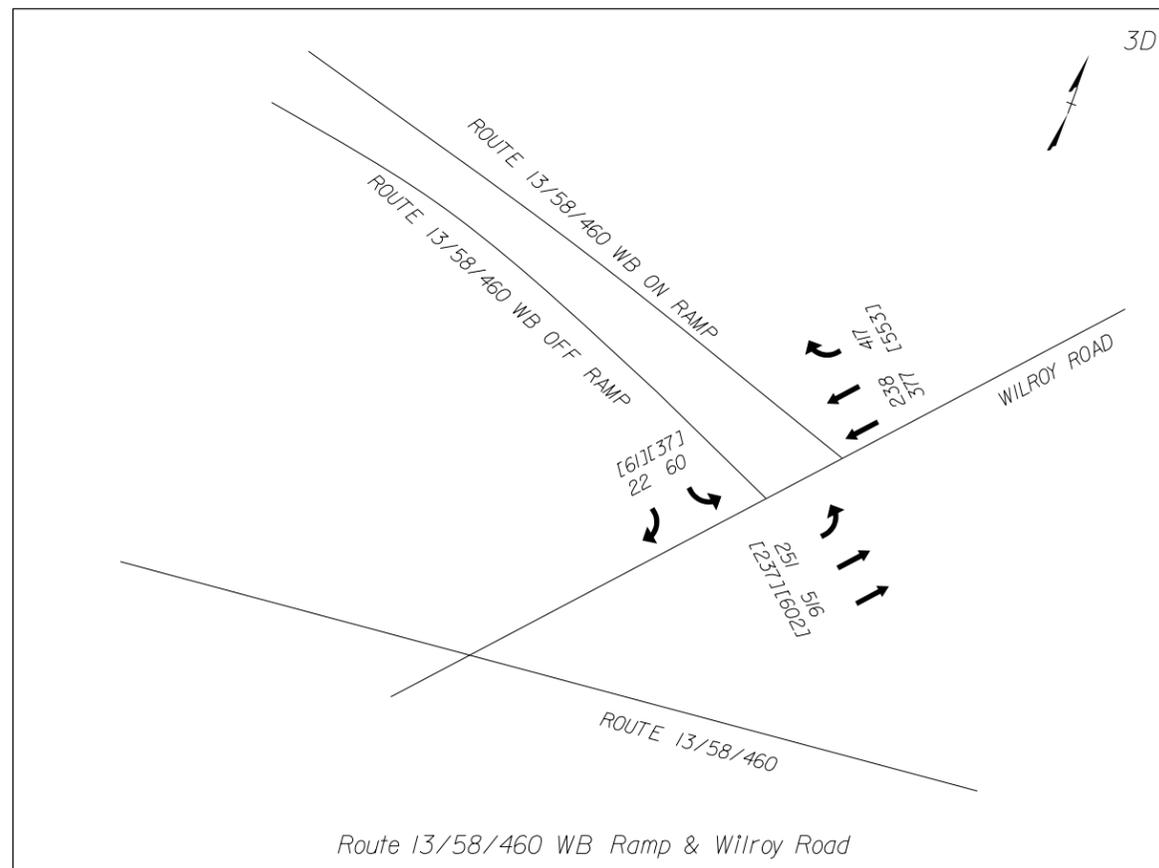

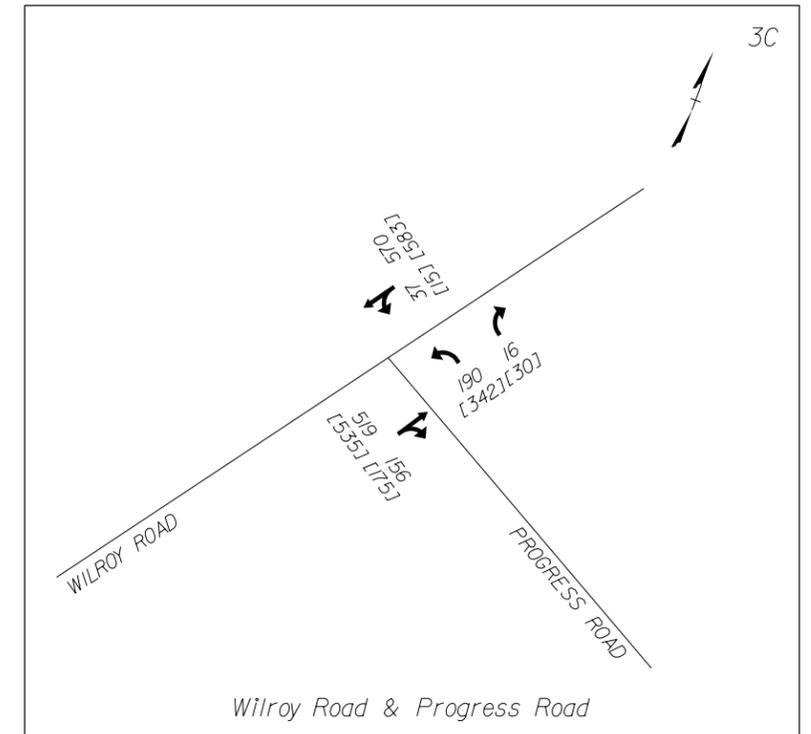

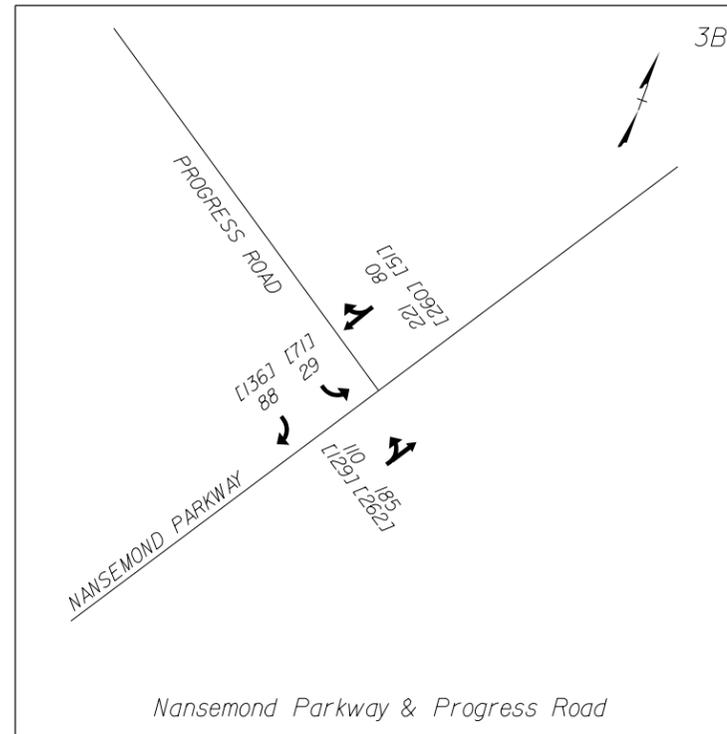

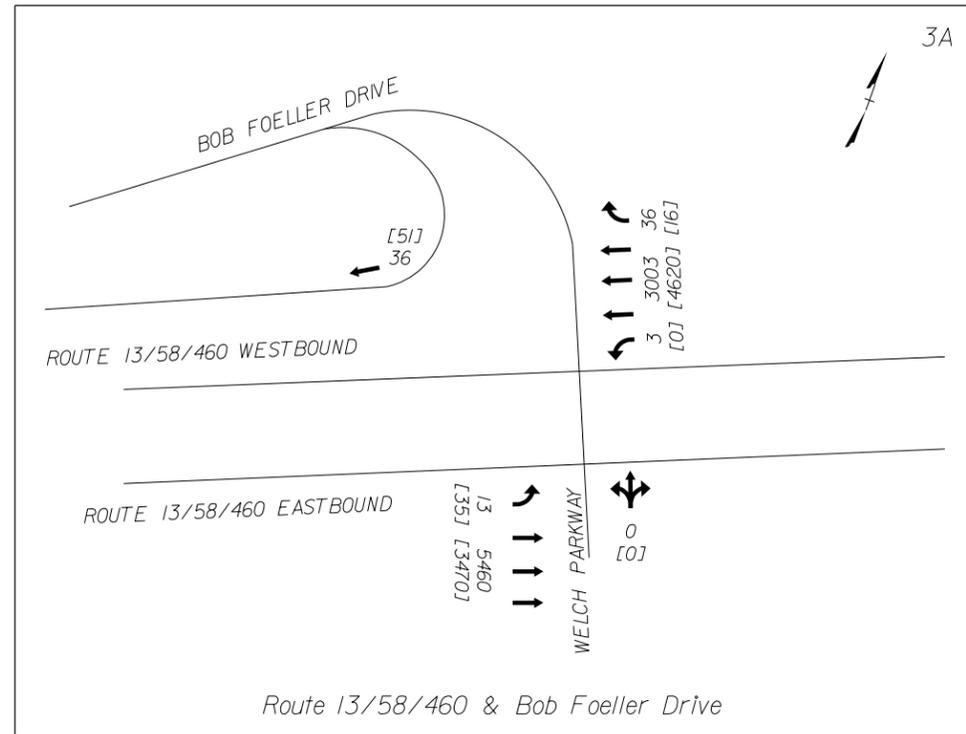

The intersection functions at an unacceptable level of service in the a.m. and p.m. peak hour. This is due to the intersection being unsignalized and the heavy volumes on the Wilroy Road approaches as shown on Figure 3D. For analysis results summary, see Table 5 and full reports in Appendix C.

3.1.6 Intersection of Wilroy Road and Route 13/58/460 EB off/on Ramps

The intersection functions at an acceptable level of service in the a.m. and p.m. peak hour. No-Build conditions volumes are displayed on Figure 3E. For analysis results summary, see Table 6 and full reports in Appendix C.

4 Trip and Forecasted Volumes

The property is currently zoned M-2 (heavy manufacturing) which only permits a limited number of uses and conditional uses. Based on information provided by SPSA, HDR included an increase in traffic volume assuming a 1% growth in waste volume per year. The operation of Cell VII, in itself, does not increase the traffic to the facility, it just provides additional disposal capacity. The operation of the Regional Landfill will change in 2018 based on the success of a new beneficial waste facility in Chesapeake where SPSA plans to send most of their waste for processing. If the new facility in Chesapeake is successful, SPSA would receive the residue from this process for disposal at the Regional Landfill. If it is not successful, SPSA would like operate the Regional Landfill as primarily as a municipal solid waste (MSW) landfill, which would have higher traffic volumes. For purposes of this study HDR has projected future traffic conditions based on the worst case operations as an MSW landfill receiving 375,000 tons per year. For the compost facility operations, HDR assumed the facility would operate at approximately 20,000 tons per year and generate an average of 35 trips per day at 2 tons per trip, and the Suffolk yard waste delivery would be 10% of the total trip volume.

The trips to the Regional Landfill from 2014 to 2015 totaled 85,491. A complete table of the Regional Landfill trips from Month Year to Month Year is located in Appendix A. The traffic growth to and from the SPSA facility were forecast to the proposed opening of Cell VII and compost facility in 2030 and at the projected life span of Cell VII in 2054.

The forecasting of general traffic for a.m. and p.m. periods was based on a 2016 traffic count performed by Intermodal Engineering, P.C. for the intersection of Route 13/58/460, Bob Foeller Drive, and Welch Parkway, Nansemond Parkway, Wilroy Road and Progress Road, Wilroy Road & Route 13/58/460 WB off Ramp, and Wilroy Road & Route 13/58/460 EB off Ramp and VDOT's annual traffic count for City of Suffolk at the study area. The traffic counts are located in Appendix B; projected growth rates are shown in Tables 7-11.

Table 7 Growth Rate: Rt 13/58/460, Bob Foeller Drive, and Welch Parkway

Annual Average Daily Traffic

Route 13/58/460, Bob Foeller Drive, and Welch Parkway

5 Analysis of Future Conditions with Development

5.1 Alternative 1: VDOT Funded Flyover

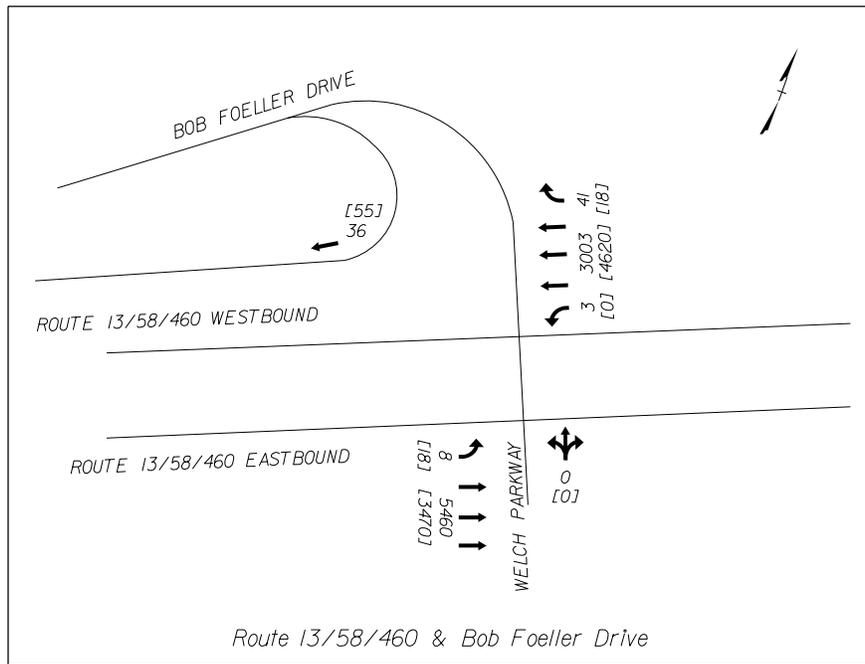

Alternative 1 consists of a new proposed VDOT funded flyover roadway in the vicinity of the Intersection at Route 13/58/460, Bob Foeller Drive, and Welch Parkway. Alternative 1 would connect the eastbound and westbound routes of Routes 13/58/460 and provide eastbound traffic with the ability to reverse direction and enter the facility through Bob Foeller Drive.

Alternative 1 would be used by the City of Suffolk refuse and yard waste trucks and residential traffic to enter the facility and by other traffic wishing to reverse their direction. Motorists would have to use the existing route to exit the SPSA facility to get on Route 13/58/460 WB. To analyze the Alternative 1 conditions, the background traffic was forecast using the growth rates found in the previous section. The a.m. and p.m. peak hour levels of service for study area intersection and ramp were computed by utilizing the Synchro 8.0 and HCM 2010.

5.1.1 Bob Foeller Drive Merge Ramp on to Route 13/58/460 Westbound

The weave segment functions at an acceptable level of service in the a.m. and p.m. peak hour. This is due to the low volumes making the ramp to freeway movement. For analysis results summary, see Table 2 and full reports in Appendix C.

ALTERNATIVE 1

LEGEND

AM Peak Hour Volume

[PM] Peak Hour Volume

Figure 4

5.2 Alternative 2: Rear Access Road to SPSA Facility

Alternative 2 consists of a new access roadway originating at western side of the SPSA property. Alternative 2 would connect to an intersection of Nansemond Parkway and Progress Road. Alternative 2 would only allow one-way thru movement to the SPSA facility for the City of Suffolk refuse and yard waste trucks and residential traffic. Motorists would have to use the existing route to exit the SPSA facility, which is the Bob Foeller Drive ramp to get on Route 13/58/460 WB. Alternative 2 would consist of a one-lane urban local road with a design speed of 30 miles per hour.

To analyze the Alternative 2 conditions, the background traffic was forecast using the growth rates found in the previous section. Unlike Alternative 1 conditions, SPSA projected traffic volumes for the City of Suffolk vehicles accessing the facility were only applied to the turning movements that lead into the facility. The volumes for the City of Suffolk vehicles leaving the facility were added to the Bob Foeller Drive Ramp volumes for analysis of the weave segment of the Route 13/58/460 WB. The a.m. and p.m. peak hour levels of service for study area intersections and ramp were computed by utilizing the Synchro 8.0 and HCM 2010.

5.2.1 Intersection of Route 13/58/460, Bob Foeller Drive, and Welch Parkway

Like Alternative 1 conditions, reducing the amount of vehicles making a left turn movement at this intersection did not improve the level of service. It still functions at unacceptable level of service in the a.m. and p.m. peak hour. This is due to the heavy volumes on the Route 13/58/460 approaches as shown on Figure 6A. For analysis results summary, see Table 1 and full reports in Appendix C.

5.2.2 Bob Foeller Drive Merge Ramp on to Route 13/58/460 Westbound

The weave segment functions at an acceptable level of service in the a.m. and p.m. peak hour. This is due to the low volumes making the ramp to freeway movement. For analysis results summary, see Table 2 and full reports in Appendix C.

5.2.3 Intersection of Nansemond Parkway and Progress Road

The intersection functions at an acceptable level of service in the a.m. peak hour and an unacceptable level of service in the p.m. peak hour. This is due to heavy volumes on Nansemond Parkway approaches as shown on Figure 6B. For analysis results summary, see Table 3 and full reports in Appendix C.

5.2.4 Intersection of Wilroy Road and Progress Road

The intersection functions at an acceptable level of service in the a.m. and p.m. peak hour. Alternative 2 conditions volumes are displayed on Figure 6C. For analysis results summary, see Table 4 and full reports in Appendix C.

5.2.5 Intersection of Wilroy Road and Route 13/58/460 WB off/on Ramps

The intersection functions at an unacceptable level of service in the a.m. and p.m. peak hour. This is due to the intersection being unsignalized and the heavy volume on the Wilroy Road approaches as shown on Figure 6D. For analysis results summary, see Table 5 and full reports in Appendix C.

5.2.6 Intersection of Wilroy Road and Route 13/58/460 EB off/on Ramps: Signalized Intersection

The intersection functions at an acceptable level of service in the a.m. and p.m. peak hour. Alternative 2 conditions volumes are displayed on Figure 6E. For analysis results summary, see Table 6 and full reports in Appendix C.

6 Signal Warrant Analysis

There are three unsignalized intersections within the study area:

- Route 13/58/460 and Bob Foeller Drive
- Nansemond Parkway and Progress Road
- Wilroy Road and Route 13/58/460 WB Ramp

A traffic signal may be justified if one or more of the warrants are met based on the 2009 MUTCD Signal Warrant Analysis methodology. The eight warrants are:

1. Warrant 1, Eight-Hour Vehicular Volume
2. Warrant 2, Four-Hour Vehicular Volume
3. Warrant 3, Peak Hour
4. Warrant 4, Pedestrian Volume
5. Warrant 5, School Crossing
6. Warrant 6, Coordinated Signal System
7. Warrant 7, Crash Experience
8. Warrant 8, Roadway Network
9. Warrant 9, Intersection Near a Grade Crossing

Only Warrant 2 and Warrant 3 apply to this study.

Warrant 2 – This warrant is intended to be applied where the volume of intersecting traffic is the principal reason to consider installing a traffic signal.

Warrant 2 is satisfied when, for each of any four hours of an average day, the plotted points that represent the vehicles per hour on both approaches of the major street and the vehicles per hour on the higher volume minor street approach (same hour), all fall above the curve provided on Figure 4C-1 of the 2009 MUTCD.

Warrant 3 – This warrant is intended to be applied where minor street traffic suffers undue delay when entering or crossing the major street. Warrant 3 is met under two conditions.

Condition A: This condition is met when all three of the following statements are true for the same one hour period of an average day.

1. The total stopped time delay experienced by the traffic on one minor-street approach (one direction only) controlled by a STOP sign equals or exceeds: 4 vehicle-hours for a one-lane approach or 5 vehicle-hours for a two-lane approach; and
2. The volume on the same minor-street approach (one direction only) equals or exceeds 100 vehicles per hour for one moving lane of traffic or 150 vehicles per hour for two moving lanes; and
3. The total entering volume serviced during the hour equals or exceeds 650 vehicles per hour for intersections with three approaches or 800 vehicles per hour for intersections with four or more approaches.

Condition B: This condition is met when the plotted point representing the vehicles per hour on the major street (total of both approaches) and the corresponding vehicles per hour on the higher-volume minor-street approach (one direction only) for 1 hour (any four consecutive 15-minute periods) of an average day falls above the applicable curve on Figure 4C-3 of 2009 MUTCD, for the existing combination of approach lanes.

The intersections were analyzed for each of the two warrants for both existing and future scenarios – No-Build, Alternative 1, and Alternative 2.

Table 12 shows the results of the traffic signal warrant analysis for the existing 2016 hourly traffic volumes for the three unsignalized intersections within the study area and Table 13 shows the results based on the future scenarios. Appendix D contains summary worksheets of the traffic volumes, volume thresholds, and analysis results.

Table 12 Signal Warrant Analysis 2016

Intersection	Warrant 2 – Four-Hour Vehicular Volume	Warrant 3 – Peak Hour Vehicular Volume
Route 13/58/460 and Bob Foeller Drive	N/A*	N/A*
Nansemond Parkway & Progress Road	N	N
Wilroy Road and Route 13/58/460 WB Ramp	N	N

Table 13 Warrant 3 Analysis for Proposed Conditions

Intersection	No-Action	Alternative 1	Alternative 2
Route 13/58/460 and Bob Foeller Drive	N/A*	N/A*	N/A*
Nansemond Parkway & Progress Road	N	N	N
Wilroy Road and Route 13/58/460 WB Ramp	N	N	N

* N/A because the minimum threshold limit for minor street is not met.

As presented in Table 12 and Table 13, none of the unsignalized intersection meets Warrant 2 or Warrant 3. Hence, all the current unsignalized intersections are recommended to remain unsignalized based on the MUTCD Signal Warrant Analysis.

7 Recommendation

The poor operational level of service of the unsignalized at the entrance to the Regional Landfill intersection is due to heavy through movements found on Route 13/58/460. Signalization would improve the intersection’s overall level of service of the turning movements; however, this intersection does not meet the MUTCD warrants for signalization. Also, signalizing this divided highway intersection increases the potential for traffic accidents, and is not a viable alternative.

Alternative 1 is the preferred alternative by SPSA to remedy the level of service of the existing entrance to the Regional Landfill for facility traffic originating from the City of Suffolk. Should the flyover not be constructed by the time Cell VII is planned for operation, SPSA would propose for consideration, implementation of Alternative 2. The proposed rear entrance road to the SPSA facility would improve the delay of the turning movements and functionality of the intersection at

Route 13/58/460, Bob Foeller Drive, and Welch Parkway. Alternative 2 would only allow one-way thru movement to the SPSA facility for the Suffolk traffic. With the City of Suffolk vehicles using the Alternative 1 to access the facility, the left turn movement at the intersection of Route 13/58/460 would be minimized. However, even without the vehicles making a left turn to enter SPSA facility, there are enough motorists making a U-turn movement at the intersection that it functions at unacceptable level of service. HDR recommends the entrance to Bob Foeller Drive from the median be removed following completion of a rear access road, in order to restrict vehicles from using the median to enter the facility. Facility signage on eastbound Route 13/58/460 would also be removed.

The proposed alternatives also provide a benefit to the City of Suffolk by eliminating the need for its refuse trucks to make the left hand turn onto Bob Foeller Drive. Potential crashes that may be caused by crossing and turning movements at the intersection of Route 13/58/460 would be minimized by either alternative. The alternatives may also reduce on the road travel time for the collection vehicles and would eliminate the difficult and dangerous crossing of westbound Route 13/58/460 especially during peak traffic times. Alternative 1 would not require any changes to the existing solid waste collection routing for the City as it would be just a more efficient and safe manner to access the facility than the current entrance. Alternative 1 would also maintain the current controlled access into the facility, and not require routing of refuse traffic through the industrial park and residential area to enter the facility through the alternate location.

8 Conclusion

SPSA is proposing to develop Cell VII at the Regional Landfill site and possibly construct and operate a vegetative waste compost facility on the existing property. This Traffic Impact Study analyzed the effect of the No-Build and Alternative 2 conditions at the following intersections and weave segment.

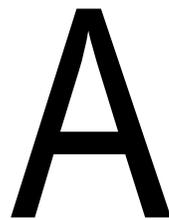

- Route 13/58/460, Bob Foeller Drive, and Welch Parkway
- Bob Foeller Drive Merge Ramp onto Route 13/58/460 WB
- Nanesmond Parkway and Progress Road
- Wilroy Road and Progress Road
- Wilroy Road and East Bound/West Bound Ramps

A capacity analysis was performed on all five locations listed for existing, No-Build and Alternative 2 conditions. For existing conditions, service levels are adequate for both peak periods at the following locations: Bob Foeller Drive Ramp on to Route 13/58/460 WB, Nanesmond Parkway and Progress Road, Wilroy Road and Progress Road, Wilroy Road and East Bound Ramps. Service level is adequate for a.m. peak at Wilroy Road and West Bound Ramps. Service level is inadequate for p.m. peak at Wilroy Road and West Bound Ramps. Service levels are inadequate for both peak periods for Bob Foeller Drive/Welch Parkway and West Military Highway (Route 13/58/460).

Under No-Build conditions, service levels are adequate for both peak periods at the following locations: Bob Foeller Drive Ramp on to Route 13/58/460 WB, Nanesmond Pkwy and Progress Road, Wilroy Road and Progress Road, Wilroy Road and East Bound Ramps. Service levels are inadequate for both peak periods at the following locations: Wilroy Road and West Bound Ramps and Bob Foeller Drive/Welch Parkway and West Military Highway (Route 13/58/460).

For Alternative 1 conditions, service levels for the Bob Foeller Drive ramp onto Route 13/58/460 WB would be adequate for both peak periods since the conflicting turn movements would be removed. Under Alternative 2 conditions, service levels are adequate for both peak periods at the following locations: Bob Foeller Drive Ramp onto Route 13/58/460 WB, Wilroy Road and Progress Road, Wilroy Road and East Bound Ramps. Service level is adequate for a.m. peak at Nansmond Parkway and Progress Road. Service level is inadequate for p.m. peak at Nansmond Parkway and Progress Road. Service levels are inadequate for both peak periods at the following locations: Wilroy Road and West Bound Ramps and Bob Foeller Drive/Welch Parkway and West Military Highway (Route 13/58/460).

Since the proposed conditions for the SPSA site will not cause further measurable deterioration at the intersection of Route 13/58/460, Bob Foeller Drive, and Welch Parkway, it is the preferred option to further the VDOT funded flyover option and eliminate the turning median traffic once an alternative access is provided for City of Suffolk refuse and yard waste vehicles and residents wishing to utilize the facility.

A large, bold, black letter 'A' is positioned on the right side of the page, partially overlapping a white rectangular area. The letter is the primary visual element of the section header.

Operational Analysis

Analyst: Kanchan BK
 Agency/Co.: HDR Engineering Inc
 Date Performed: 6/21/2016
 Analysis Time Period: AM Peak
 Freeway/Dir of Travel: Route 13/58/460 Westbound
 Weaving Location: Ramp to Portsmouth Blvd
 Analysis Year: 2016
 Description: SPSA Traffic Impact Assessment - Existing

Inputs

Segment Type	Freeway	
Weaving configuration	One-Sided	
Number of lanes, N	4	ln
Weaving segment length, LS	875	ft
Freeway free-flow speed, FFS	60	mi/h
Minimum segment speed, SMIN	60	mi/h
Freeway maximum capacity, cIFL	1900*	pc/h/ln
Terrain type	Level	
Grade	0.00	%
Length	0.00	mi

Conversion to pc/h Under Base Conditions

	Volume Components				veh/h
	VFF	VRF	VFR	VRR	
Volume, V	1169	3	0	989	
Peak hour factor, PHF	0.85	0.69	0.25	0.85	
Peak 15-min volume, v15	344	1	0	291	
Trucks and buses	7	100	0	8	%
Recreational vehicles	0	0	0	0	%
Trucks and buses PCE, ET	1.5	1.5	1.5	1.5	
Recreational vehicle PCE, ER	1.2	1.2	1.2	1.2	
Heavy vehicle adjustment, fHV	0.966	0.667	1.000	0.962	
Driver population adjustment, fP	1.00	1.00	1.00	1.00	
Flow rate, v	1423	7	0	1210	pc/h
Volume ratio, VR		0.003			

Configuration Characteristics

Number of maneuver lanes, NWL	2	ln
Interchange density, ID	1.0	int/mi
Minimum RF lane changes, LCRF	2	lc/pc
Minimum FR lane changes, LCFR	1	lc/pc
Minimum RR lane changes, LCRR		lc/pc
Minimum weaving lane changes, LCMIN	14	lc/h
Weaving lane changes, LCW	275	lc/h
Non-weaving vehicle index, INW	230	
Non-weaving lane change, LCNW	246	lc/h
Total lane changes, LCALL	521	lc/h

Weaving and Non-Weaving Speeds

Weaving intensity factor, W	0.150
-----------------------------	-------

Average weaving speed, SW	60.0	mi/h
Average non-weaving speed, SNW	56.7	mi/h

_____Weaving Segment Speed, Density, Level of Service and Capacity_____

Weaving segment speed, S	56.7	mi/h
Weaving segment density, D	11.6	pc/mi/ln
Level of service, LOS	B	
Weaving segment v/c ratio		
Weaving segment flow rate, v		veh/h
Weaving segment capacity, cW		veh/h

_____Limitations on Weaving Segments_____

If limit reached, see note.

	Minimum	Maximum	Actual	Note
Weaving length (ft)	300	2620	875	a,b
Density-based capacity, cIWL (pc/h/ln)		1900*	1766	c
v/c ratio		1.00	Analyzed	d

Notes:

- In weaving segments shorter than 300 ft, weaving vehicles are assumed to make only necessary lane changes.
- Weaving segments longer than the calculated maximum length should be treated as isolated merge and diverge areas using the procedures of Chapter 13, "Freeway Merge and Diverge Segments."
- The density-based capacity exceeds the capacity of a basic freeway segment, under equivalent ideal conditions.
- Volumes exceed the weaving segment capacity. The level of service is F.

Operational Analysis

Analyst: Kanchan BK
 Agency/Co.: HDR Engineering Inc
 Date Performed: 6/21/2016
 Analysis Time Period: AM Peak
 Freeway/Dir of Travel: Route 13/58/460 Westbound
 Weaving Location: Ramp to Portsmouth Blvd
 Analysis Year: 2030
 Description: SPSA Traffic Impact Assessment - No Built

Inputs

Segment Type	Freeway	
Weaving configuration	One-Sided	
Number of lanes, N	4	ln
Weaving segment length, LS	875	ft
Freeway free-flow speed, FFS	60	mi/h
Minimum segment speed, SMIN	60	mi/h
Freeway maximum capacity, cIFL	1900*	pc/h/ln
Terrain type	Level	
Grade	0.00	%
Length	0.00	mi

Conversion to pc/h Under Base Conditions

	Volume Components				
	VFF	VRF	VFR	VRR	
Volume, V	1651	3	0	1388	veh/h
Peak hour factor, PHF	0.85	0.69	0.25	0.85	
Peak 15-min volume, v15	486	1	0	408	
Trucks and buses	7	100	0	8	%
Recreational vehicles	0	0	0	0	%
Trucks and buses PCE, ET	1.5	1.5	1.5	1.5	
Recreational vehicle PCE, ER	1.2	1.2	1.2	1.2	
Heavy vehicle adjustment, fHV	0.966	0.667	1.000	0.962	
Driver population adjustment, fP	1.00	1.00	1.00	1.00	
Flow rate, v	2010	7	0	1698	pc/h
Volume ratio, VR		0.002			

Configuration Characteristics

Number of maneuver lanes, NWL	2	ln
Interchange density, ID	1.0	int/mi
Minimum RF lane changes, LCRF	2	lc/pc
Minimum FR lane changes, LCFR	1	lc/pc
Minimum RR lane changes, LCRR		lc/pc
Minimum weaving lane changes, LCMIN	14	lc/h
Weaving lane changes, LCW	275	lc/h
Non-weaving vehicle index, INW	324	
Non-weaving lane change, LCNW	468	lc/h
Total lane changes, LCALL	743	lc/h

Weaving and Non-Weaving Speeds

Weaving intensity factor, W	0.199
-----------------------------	-------

Average weaving speed, SW	60.0	mi/h
Average non-weaving speed, SNW	55.4	mi/h

_____Weaving Segment Speed, Density, Level of Service and Capacity_____

Weaving segment speed, S	55.4	mi/h
Weaving segment density, D	16.7	pc/mi/ln
Level of service, LOS	B	
Weaving segment v/c ratio		
Weaving segment flow rate, v		veh/h
Weaving segment capacity, cW		veh/h

_____Limitations on Weaving Segments_____

If limit reached, see note.

	Minimum	Maximum	Actual	Note
Weaving length (ft)	300	2613	875	a,b
Density-based capacity, cIWL (pc/h/ln)		1900*	1767	c
v/c ratio		1.00	Analyzed	d

Notes:

- In weaving segments shorter than 300 ft, weaving vehicles are assumed to make only necessary lane changes.
- Weaving segments longer than the calculated maximum length should be treated as isolated merge and diverge areas using the procedures of Chapter 13, "Freeway Merge and Diverge Segments."
- The density-based capacity exceeds the capacity of a basic freeway segment, under equivalent ideal conditions.
- Volumes exceed the weaving segment capacity. The level of service is F.

Operational Analysis

Analyst: Kanchan BK
 Agency/Co.: HDR Engineering Inc
 Date Performed: 6/21/2016
 Analysis Time Period: AM Peak
 Freeway/Dir of Travel: Route 13/58/460 Westbound
 Weaving Location: Ramp to Portsmouth Blvd
 Analysis Year: 2030
 Description: SPSA Traffic Impact Assessment - Alternative 1

Inputs

Segment Type	Freeway	
Weaving configuration	One-Sided	
Number of lanes, N	4	ln
Weaving segment length, LS	875	ft
Freeway free-flow speed, FFS	60	mi/h
Minimum segment speed, SMIN	60	mi/h
Freeway maximum capacity, cIFL	1900*	pc/h/ln
Terrain type	Level	
Grade	0.00	%
Length	0.00	mi

Conversion to pc/h Under Base Conditions

	Volume Components				
	VFF	VRF	VFR	VRR	
Volume, V	1651	0	0	1388	veh/h
Peak hour factor, PHF	0.85	0.25	0.25	0.85	
Peak 15-min volume, v15	486	0	0	408	
Trucks and buses	7	100	7	8	%
Recreational vehicles	0	0	0	0	%
Trucks and buses PCE, ET	1.5	1.5	1.5	1.5	
Recreational vehicle PCE, ER	1.2	1.2	1.2	1.2	
Heavy vehicle adjustment, fHV	0.966	0.667	0.966	0.962	
Driver population adjustment, fP	1.00	1.00	1.00	1.00	
Flow rate, v	2010	0	0	1698	pc/h
Volume ratio, VR		0.000			

Configuration Characteristics

Number of maneuver lanes, NWL	2	ln
Interchange density, ID	1.0	int/mi
Minimum RF lane changes, LCRF	2	lc/pc
Minimum FR lane changes, LCFR	1	lc/pc
Minimum RR lane changes, LCRR		lc/pc
Minimum weaving lane changes, LCMIN	0	lc/h
Weaving lane changes, LCW	261	lc/h
Non-weaving vehicle index, INW	324	
Non-weaving lane change, LCNW	468	lc/h
Total lane changes, LCALL	729	lc/h

Weaving and Non-Weaving Speeds

Weaving intensity factor, W	0.196
-----------------------------	-------

Average weaving speed, SW	60.0	mi/h
Average non-weaving speed, SNW	55.6	mi/h

_____Weaving Segment Speed, Density, Level of Service and Capacity_____

Weaving segment speed, S	55.6	mi/h
Weaving segment density, D	16.7	pc/mi/ln
Level of service, LOS	B	
Weaving segment v/c ratio	0.523	
Weaving segment flow rate, v	3576	veh/h
Weaving segment capacity, cW	6833	veh/h

_____Limitations on Weaving Segments_____

If limit reached, see note.

	Minimum	Maximum	Actual	Note
Weaving length (ft)	300	2596	875	a,b
Density-based capacity, cIWL (pc/h/ln)		1900*	1768	c
v/c ratio		1.00	0.523	d

Notes:

- In weaving segments shorter than 300 ft, weaving vehicles are assumed to make only necessary lane changes.
- Weaving segments longer than the calculated maximum length should be treated as isolated merge and diverge areas using the procedures of Chapter 13, "Freeway Merge and Diverge Segments."
- The density-based capacity exceeds the capacity of a basic freeway segment, under equivalent ideal conditions.
- Volumes exceed the weaving segment capacity. The level of service is F.

Operational Analysis

Analyst: Kanchan BK
 Agency/Co.: HDR Engineering Inc
 Date Performed: 6/21/2016
 Analysis Time Period: PM Peak
 Freeway/Dir of Travel: Route 13/58/460 Westbound
 Weaving Location: Ramp to Portsmouth Blvd
 Analysis Year: 2030
 Description: SPSA Traffic Impact Assessment - Alternative 1

Inputs

Segment Type	Freeway	
Weaving configuration	One-Sided	
Number of lanes, N	4	ln
Weaving segment length, LS	875	ft
Freeway free-flow speed, FFS	60	mi/h
Minimum segment speed, SMIN	60	mi/h
Freeway maximum capacity, cIFL	1900*	pc/h/ln
Terrain type	Level	
Grade	0.00	%
Length	0.00	mi

Conversion to pc/h Under Base Conditions

	Volume Components				
	VFF	VRF	VFR	VRR	
Volume, V	2541	0	0	2134	veh/h
Peak hour factor, PHF	0.93	0.25	0.25	0.93	
Peak 15-min volume, v15	683	0	0	574	
Trucks and buses	7	100	100	8	%
Recreational vehicles	0	0	0	0	%
Trucks and buses PCE, ET	1.5	1.5	1.5	1.5	
Recreational vehicle PCE, ER	1.2	1.2	1.2	1.2	
Heavy vehicle adjustment, fHV	0.966	0.667	0.667	0.962	
Driver population adjustment, fP	1.00	1.00	1.00	1.00	
Flow rate, v	2828	0	0	2386	pc/h
Volume ratio, VR		0.000			

Configuration Characteristics

Number of maneuver lanes, NWL	2	ln
Interchange density, ID	1.0	int/mi
Minimum RF lane changes, LCRF	2	lc/pc
Minimum FR lane changes, LCFR	1	lc/pc
Minimum RR lane changes, LCRR		lc/pc
Minimum weaving lane changes, LCMIN	0	lc/h
Weaving lane changes, LCW	261	lc/h
Non-weaving vehicle index, INW	456	
Non-weaving lane change, LCNW	778	lc/h
Total lane changes, LCALL	1039	lc/h

Weaving and Non-Weaving Speeds

Weaving intensity factor, W	0.259
-----------------------------	-------

Average weaving speed, SW	60.0	mi/h
Average non-weaving speed, SNW	53.7	mi/h

_____Weaving Segment Speed, Density, Level of Service and Capacity_____

Weaving segment speed, S	53.7	mi/h
Weaving segment density, D	24.3	pc/mi/ln
Level of service, LOS	C	
Weaving segment v/c ratio	0.736	
Weaving segment flow rate, v	5027	veh/h
Weaving segment capacity, cW	6833	veh/h

_____Limitations on Weaving Segments_____

If limit reached, see note.

	Minimum	Maximum	Actual	Note
Weaving length (ft)	300	2596	875	a,b
Density-based capacity, cIWL (pc/h/ln)		1900*	1768	c
v/c ratio		1.00	0.736	d

Notes:

- In weaving segments shorter than 300 ft, weaving vehicles are assumed to make only necessary lane changes.
- Weaving segments longer than the calculated maximum length should be treated as isolated merge and diverge areas using the procedures of Chapter 13, "Freeway Merge and Diverge Segments."
- The density-based capacity exceeds the capacity of a basic freeway segment, under equivalent ideal conditions.
- Volumes exceed the weaving segment capacity. The level of service is F.
